

# Kernel Data Structures

- Many similar to standard programming data structures

- ***Singly linked list***

- ***Doubly linked list***

- ***Circular linked list***

# Kernel Data Structures

## ■ Binary search tree

left  $\leq$  right

- Search performance is  $O(n)$
- **Balanced binary search tree** is  $O(\lg n)$

# Kernel Data Structures

- **Hash function** can create a **hash map**

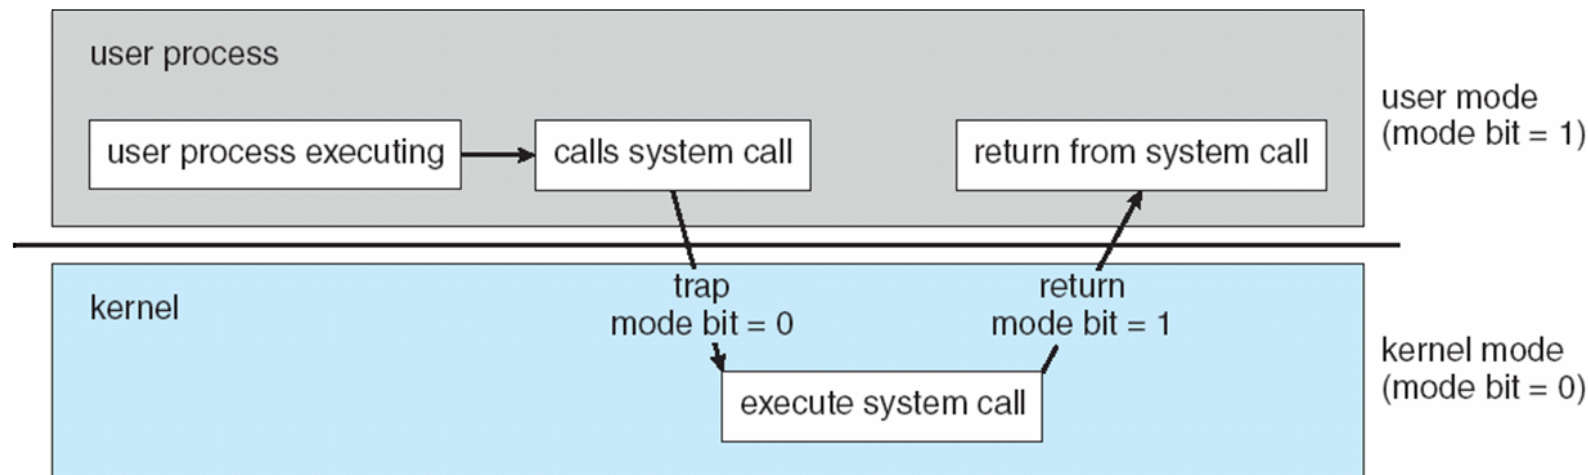

- **Bitmap** – string of  $n$  binary digits representing the status of  $n$  items
- Linux data structures defined in  
***include*** files `<linux/list.h>`, `<linux/kfifo.h>`,  
`<linux/rbtree.h>`

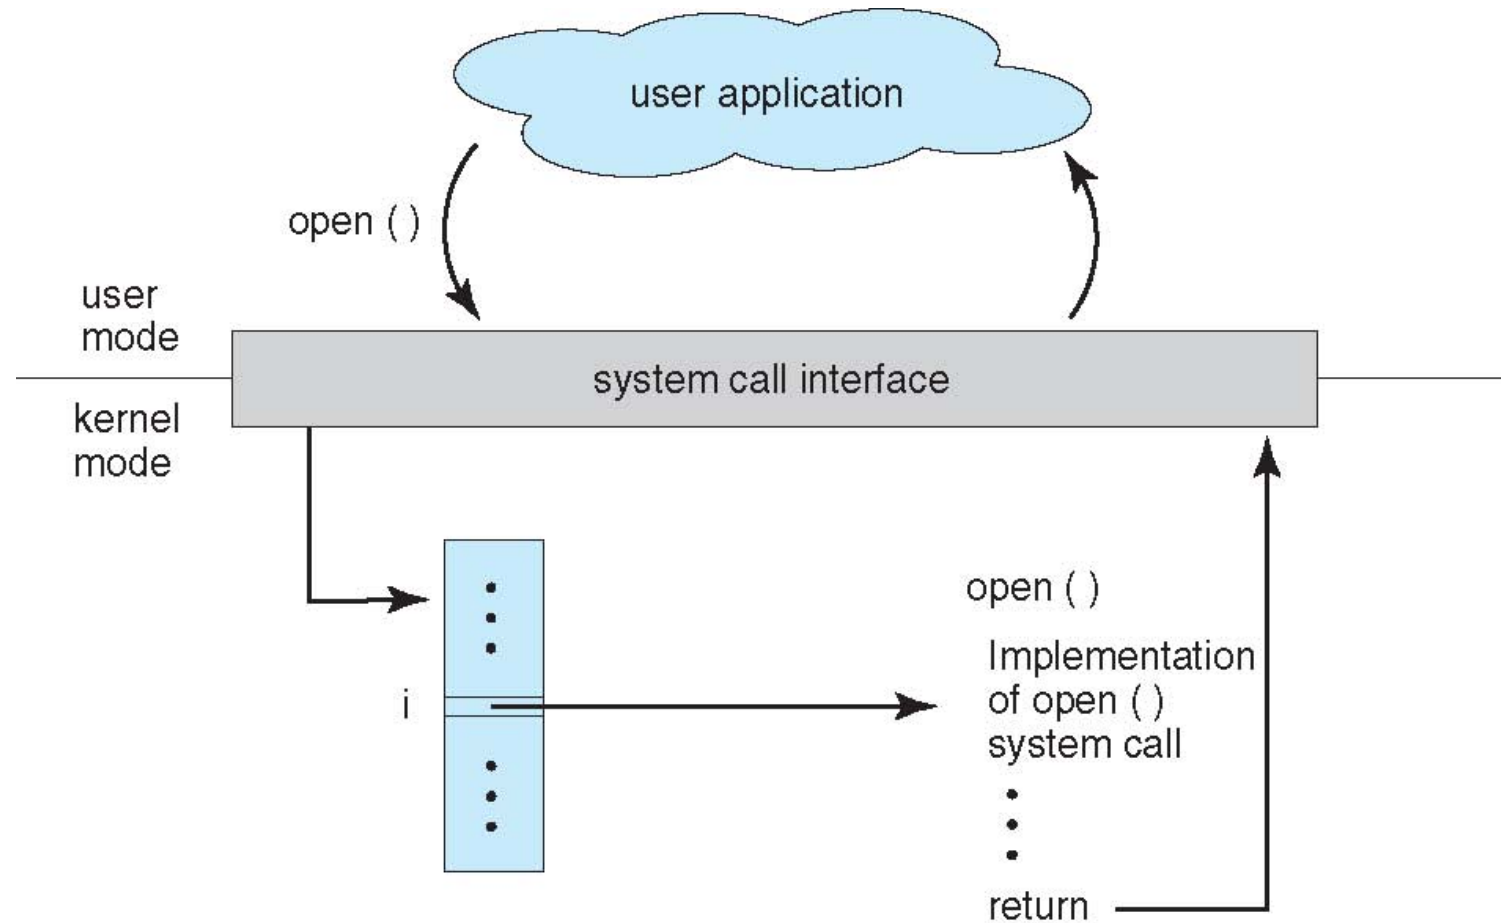

# Transition from User to Kernel Mode

- Timer to prevent infinite loop / process hogging resources
  - Timer is set to interrupt the computer after some time period
  - Keep a counter that is decremented by the physical clock.
  - Operating system set the counter (privileged instruction)
  - When counter zero generate an interrupt
  - Set up before **scheduling** process to regain control or terminate program that exceeds allotted time

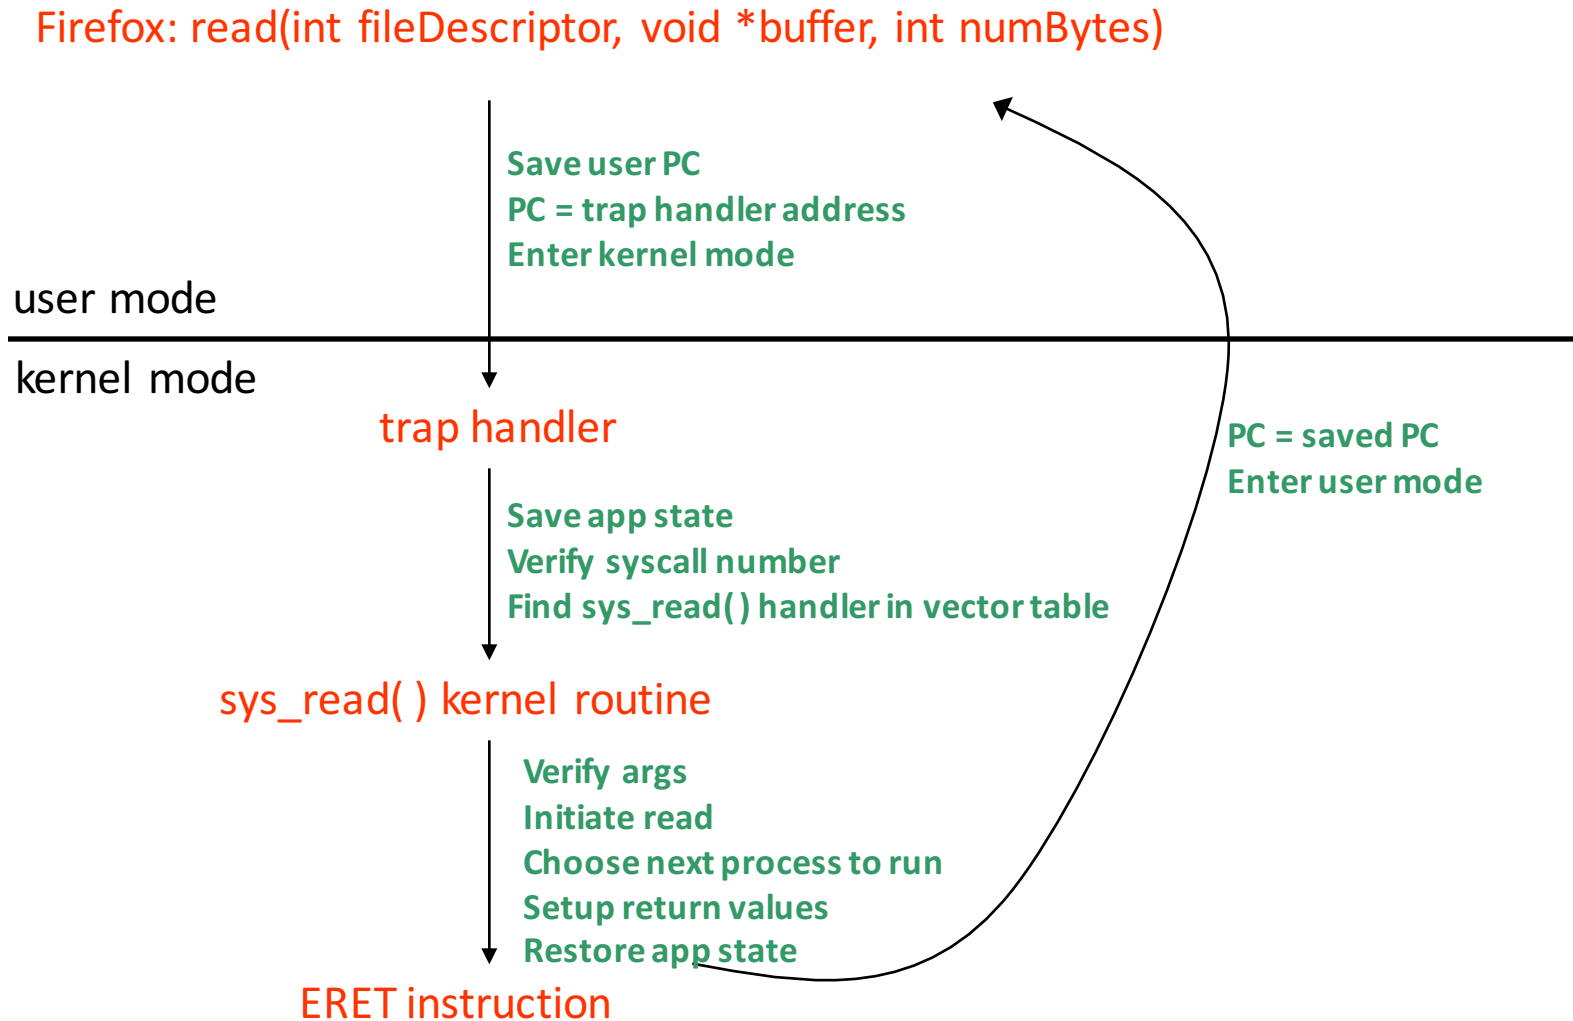

# API – System Call – OS Relationship

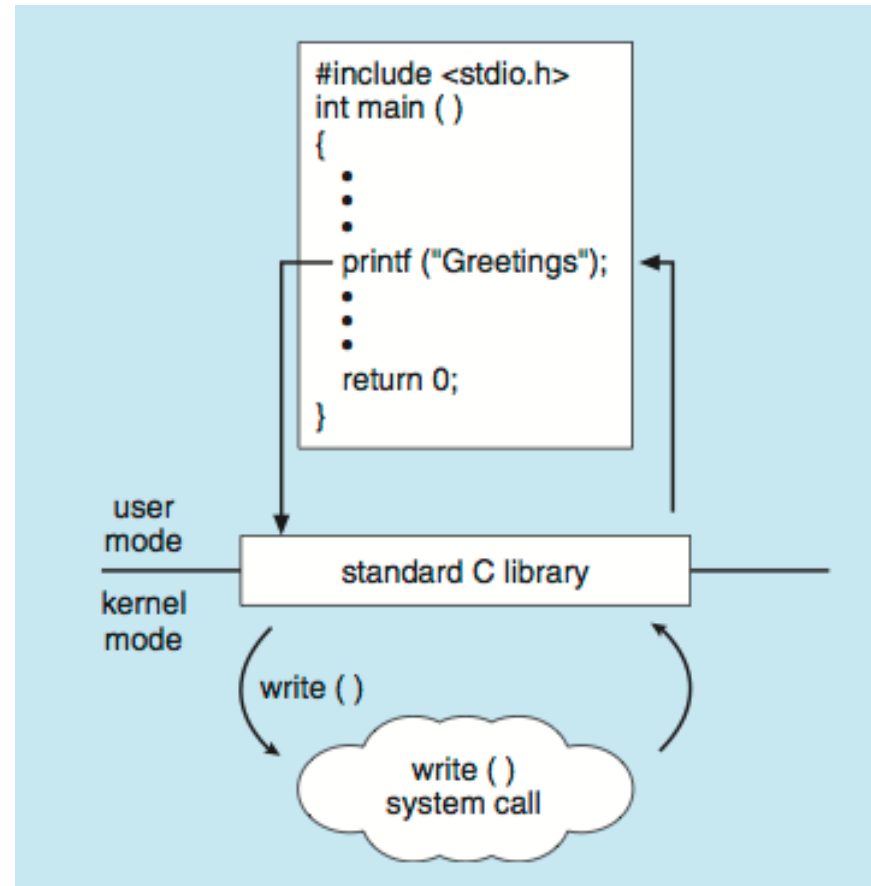

# A kernel crossing illustrated

# Standard C Library Example

- C program invoking printf() library call, which calls write() system call

- The syscall instruction atomically:
  - Saves the current PC
  - Sets the execution mode to privileged
  - Sets the PC to a handler address
- With that, it's a lot like a local procedure call
  - Caller puts arguments in a place callee expects (registers or stack)
    - One of the args is a syscall number, indicating which OS function to invoke
  - Callee (OS) saves caller's state (registers, other control state) so it can use the CPU
  - OS function code runs
    - OS must verify caller's arguments (e.g., pointers)
  - OS returns using a special instruction
    - Automatically sets PC to return address and sets execution mode to user

# WRAPPER for System calls!

- generally not invoked directly, but rather via wrapper functions in glibc (or some other library).
- glibc includes  
open, read, write, malloc, printf, pthread\_create, exit and more.
  - <https://www.gnu.org/software/libc/libc.html>
- See the list of system calls here <http://man7.org/linux/man-pages/man2/syscalls.2.html>

# Programs (Assignment 2)

(maybe threads!)

# Concurrency (more in Assignment 2)

# Parallelism

# Processors and cores! (Assignment 2)

# Memory Sharing (part of A2...)

Memory

# Virtual Memory

# Files (Assignment 3)

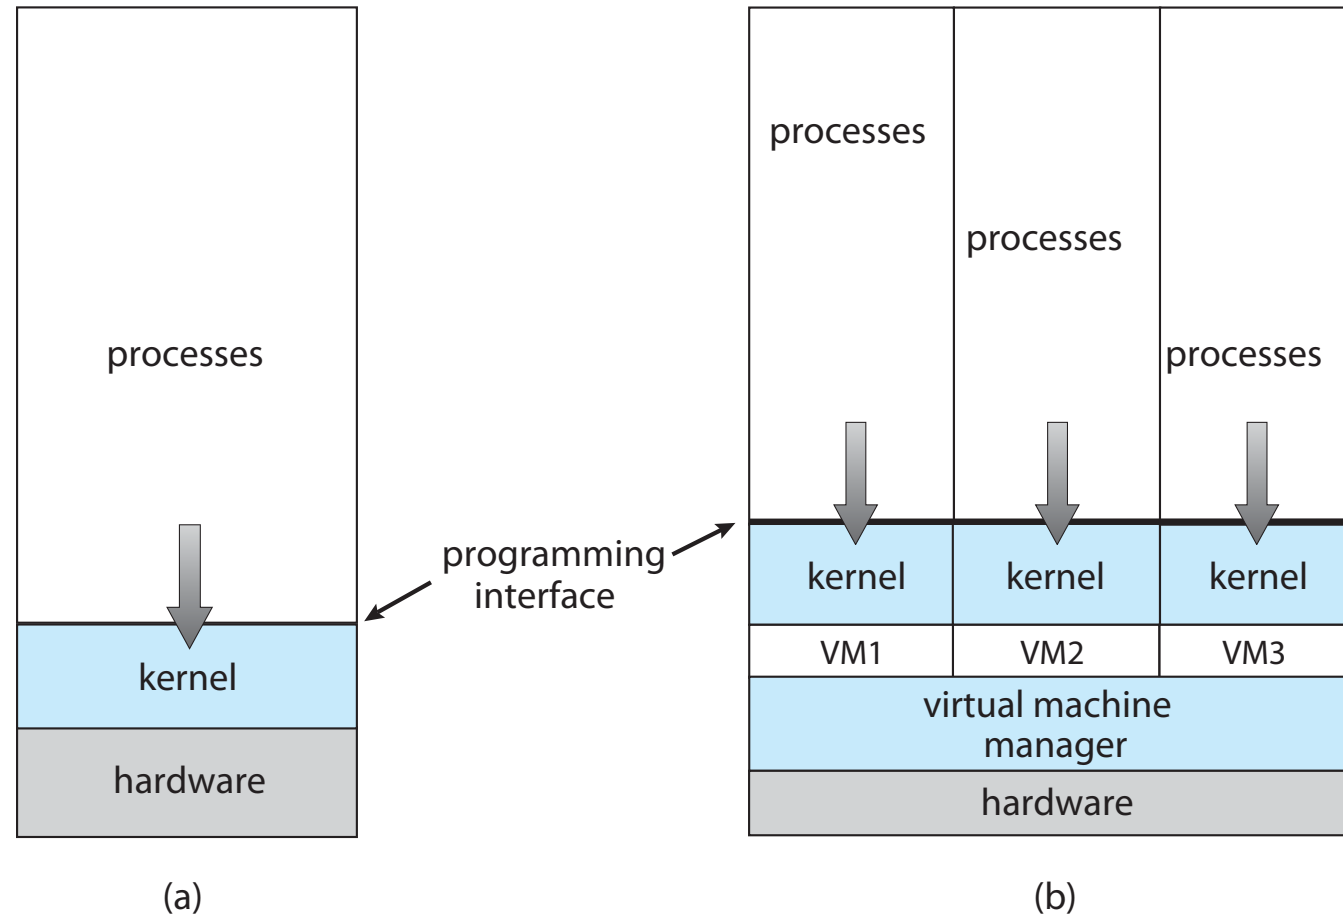

# There are a lot of Issues...

- Naming!
- Allocating space on disk (permanent storage)
  - organized for fast access
  - minimize waste
- Shuffling data between disk and memory (high-speed temporary storage)
- Coping with crashes

# Computing Environments - Virtualization

# Computing Environments – Cloud Computing

- Delivers computing, storage, even apps as a service across a network
- Logical extension of virtualization because it uses virtualization as the base for its functionality.
  - Amazon **EC2** has thousands of servers, millions of virtual machines, petabytes of storage available across the Internet, pay based on usage
- Many types
  - **Public cloud** – available via Internet to anyone willing to pay
  - **Private cloud** – run by a company for the company's own use
  - **Hybrid cloud** – includes both public and private cloud components
  - Software as a Service (**SaaS**) – one or more applications available via the Internet (i.e., word processor)
  - Platform as a Service (**PaaS**) – software stack ready for application use via the Internet (i.e., a database server)
  - Infrastructure as a Service (**IaaS**) – servers or storage available over Internet (i.e., storage available for backup use)

# Computing Environments – Cloud Computing

- Cloud computing environments composed of traditional OSES, plus VMMs, plus cloud management tools
  - Internet connectivity requires security like firewalls
  - Load balancers spread traffic across multiple applications

# Computing Environments – Real-Time Embedded Systems

---

- Real-time embedded systems most prevalent form of computers
  - Vary considerable, special purpose, limited purpose OS, **real-time OS**
  - Use expanding
- Many other special computing environments as well
  - Some have OSES, some perform tasks without an OS
- Real-time OS has well-defined fixed time constraints
  - Processing ***must*** be done within constraint
  - Correct operation only if constraints met

# Bourne Shell Command Interpreter
